

What is claimed is:

1. A dispensing device for fluid medicine, comprising:

a housing having an opening leading to an interior, a first aperture, and a second aperture;

5 a plastic dropper bottle at least partially disposed in said interior through said opening, said bottle having a container holding fluid medicine to be dispensed and a nozzle with a third aperture in fluid communication with said container;

a drop counter switch disposed in said housing; and

10 a lever rotationally coupled to said housing and having a first flange disposed in said first aperture for causing said bottle to dispense said fluid through said third aperture and a second flange disposed in said second aperture for operative engagement with said drop counter switch upon said first flange causing said bottle to dispense said fluid through said third aperture.

15 2. The dispensing device of claim 1 wherein said interior has a geometry that frictionally and removably receives a selected one of said containers having an oval cross-sectional geometry.

20 3. The dispensing device of claim 1 wherein said interior has a geometry that may frictionally and removably receive either a selected one of said containers having a circular cross-sectional geometry or a selected one of said containers having an oval cross-sectional geometry.
